was also found to block the recruitment of SRC-1 at AF1 of ERβ, this ligand-independent activation of AF1 being closely. . . protein kinase. Most importantly, the antiestrogen hydroxytamoxifen has no inhibitory effect on the SRC-1-induced ERβ activity while the pure antiestrogen **EM-652** completely abolishes this effect, thus strengthening the need to use pure antiestrogens in breast cancer therapy in order to control. . . up to 5 yr become neg. at longer time intervals and why resistance develops to tamoxifen. EM-800, the prodrug of **EM-652**, has been shown to prevent the development of dimethylbenz(a)anthracene (DMBA)-induced mammary carcinoma in the rat, a well-recognized model of human. . . Uterine size was reduced to castration levels in the groups of animals treated with EM-800. An almost complete disappearance of **estrogen** receptors was observed in the uterus, vaginum and tumors in nude mice treated with EM-800. **EM-652** was the most potent antiestrogen to inhibit the growth of human breast cancer ZR-75-1, MCF-7 and T-47D cells in vitro when compared with ICI 182780, ICI 164384, hydroxytamoxifen, and droloxifene. Moreover, **EM-652** and EM-800 have no stimulatory effect on the basal levels of cell proliferation in the absence of E2 while hydroxytamoxifen and droloxifene had a stimulatory effect on the basal growth of T-47D and ZR-75-1 cells. **EM-652** was also the most potent inhibitor of the percentage of cycling cancer cells. When human breast cancer ZR-75-1 xenografts were grown in nude mice, EM-800 led to a complete inhibition of the stimulatory effect of **estrogens** in ovariectomized mice while tamoxifen was less potent and even stimulated the growth of the tumors in the absence of **estrogens**, thus illustrating the stimulatory effect of tamoxifen on breast cancer growth. When incubated with human Ishikawa endometrial carcinoma cells, EM-800 had no stimulatory effect on alkaline phosphatase activity, an **estrogen**-sensitive parameter. Raloxifene, droloxifene, hydroxytoremifene and hydroxytamoxifen, on the other hand, all stimulated to various extent, the activity of this enzyme.. . . tamoxifen failure patients where EM-800 (SCH 57050) is compared to Arimidex. The detailed information obtained at the preclin. level with **EM-652** or EM-800 indicates that these orally active compds. are highly potent and pure antiestrogens in the mammary gland and endometrium. . .

(α and β; activity of **EM-652** (**SCH 57068**) antiestrogen in mammary gland and endometrium)

L7 ANSWER 19 OF 24 CAPLUS COPYRIGHT 2005 ACS on STN

AB Tamoxifen (TAM), the only antiestrogen currently available for the endocrine therapy of breast cancer behaves as a mixed agonist/antagonist of **estrogen** action, thus limiting its therapeutic potential. We report the binding characteristics of a novel series of nonsteroidal antiestrogens to the rat uterine **estrogen** receptor. As measured by competition studies, the affinity of **EM-652**, the active metabolite of the prodrug EM-800, for the **estrogen** receptor is 7-11 times higher than that of 17β- **estradiol** (E2), ICI 182780, and hydroxy-tamoxifen (OH-TAM), the active metabolite of Tamoxifen. **EM-652** is 20+ more potent than ICI 164384 and Droloxifene while it is 400 times more potent than Toremifene in displacing [3H]E2 from the rat uterine **estrogen** receptor. On the other hand, the prodrug EM-800 and Tamoxifen have resp. 150-fold and 410-fold less affinity for the **estrogen** receptor than the pure antiestrogen **EM-652**. No significant binding of **EM-652**, EM-800, TAM or OH-TAM was observed to the rat uterine progesterone receptor at concns. up to 10 000 nM except for TAM that caused a 50% displacement of labeled R5020 at 4000 nM. No

significant binding of **EM-652** or EM-800 was observed on the rat ventral prostate androgen receptor or the rat uterine progesterone receptor. The present data demonstrate the high affinity and specificity of the new antiestrogen, **EM-652**, for the rat uterine **estrogen** receptor. The antiestrogen **EM-652** thus becomes the compound having the highest known affinity for the **estrogen** receptor. Due to its unique potency and its pure antiestrogenic activity already demonstrated in many systems, this antiestrogen could well offer an important advance for the endocrine therapy of breast cancer, uterine cancer, and other **estrogen** -sensitive diseases in women.

(binding characteristics of nonsteroidal antiestrogens to uterine **estrogen** receptors)

L7 ANSWER 20 OF 24 CAPLUS COPYRIGHT 2005 ACS on STN

AB It has recently been suggested that mutation of a conserved tyrosine to asparagine within the ligand-binding domain of the **estrogen** receptor (ER) α confers hormone-independent activation and insensitivity to antiestrogens. In view of the recent discovery of ERβ and the development of the novel nonsteroidal antiestrogen EM-800 and its active metabolite **EM-652**, the authors decided to reexamine this issue by introducing a series of mutations at the conserved tyrosine 537 in ERα and 443 in ERβ and measuring their transcriptional activity in the absence and presence of **estradiol** and the antiestrogens **EM-652**, ICI 182,780, and 4-hydroxytamoxifen. As demonstrated previously for ERα, the authors observed that substituting a serine or asparagine but not. . .

IT 68047-06-3, 4-Hydroxytamoxifen 129453-61-8, ICI-182780 **182167-02-8**, **EM 652**
RL: BAC (Biological activity or effector, except adverse); BPR (Biological process); BSU (Biological study, unclassified); BIOL (Biological study); PROC (Process)
(ligand-independent activation of the **estrogen** receptors α and β by mutations of a conserved tyrosine can be abolished by antiestrogens)

L7 ANSWER 21 OF 24 CAPLUS COPYRIGHT 2005 ACS on STN

AB **Estrogens** act as potent mitogens in a large number of breast cancers, and the use of **estrogen** receptor (ER) antagonists is, therefore, considered the endocrine therapy of choice in the management of this disease. We describe the mol. properties of **EM-652** , the active metabolite of EM-800, a novel nonsteroidal antiestrogen compound, on the transcriptional functions of ERα and ERβ. Using RT-PCR, . . . that both receptors should be considered putative targets for antiestrogen action in the breast. In cotransfection assays using a synthetic **estrogen**-responsive promoter, **EM-652** shows no agonistic activity on ERα and ERβ transcriptional function and blocks the **estradiol** (E2)-mediated activation of both ERα and ERβ. **EM-652** is also very effective in abrogating E2-stimulated ERα and ERβ trans-activation of the pS2 promoter in HeLa cells. **EM-652** does not alter binding of ERα and ERβ to DNA. The Ras-mediated induction of ERα and ERβ transcriptional activity in the presence of E2 is also completely abolished by **EM-652**. In addition, **EM-652** blocks the E2-dependent activation of ERα and ERβ by the steroid hormone receptor coactivator-1 as well as the in vitro. . .

IT **182167-02-8**, **EM 652** 182167-03-9, EM-800
RL: BAC (Biological activity or effector, except adverse); BSU (Biological

study, unclassified); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(EM-800, a novel antiestrogen, acts as a pure antagonist of the transcriptional functions of **estrogen** receptors α and β)

L7 ANSWER 22 OF 24 CAPLUS COPYRIGHT 2005 ACS on STN
AB Since **estrogens** play a predominant role in the development and growth of human breast cancer, antiestrogens represent a logical approach to the treatment of this disease. The present study compares the effects of the novel non-steroidal anti-**estrogen** EM-800 and related compds. with those of a series of anti-**estrogens** on basal and 17β- **estradiol** (E2)-induced cell proliferation in human breast cancer cell lines. In the absence of added E2, EM-800 and related compds. failed. . . . lines. The stimulation of T-47D cell proliferation induced by 0.1 nM E2 was competitively blocked by a simultaneous incubation with **EM-652**, EM-800, OH-tamoxifen, OH-toremifene, ICI 182780, ICI 164384, droloxifene, tamoxifen and toremifene at apparent Ki values of 0.015, 0.011-0.017, 0.040-0.054, 0.043,. . . and 0.735 nM, approx., 10 nM and >10 nM, resp. Similar data were obtained in ZR-75-1 and/or MCF-7 cells. Moreover, **EM-652** was 6-fold more potent than OH-Tamoxifen in inhibiting the proportion of cycling MCF-7 cells. Our data show that EM-800 and **EM-652** are the most potent known antiestrogens in human breast cancer cells in vitro and that they are devoid of the estrogenic activity of OH-tamoxifen and droloxifene suggested by stimulation of cell growth in the absence of **estrogens** in ZR-75-1 and MCF-7 cells.
IT 10540-29-1, Tamoxifen 68047-06-3, 4-Hydroxy-tamoxifen 82413-20-5, Droloxifene 89778-26-7, Toremifene 98007-99-9, ICI 164384 110503-62-3, 4-Hydroxy toremifene 129453-61-8, ICI 182780 151533-34-5, EM 343 **182167-02-8**, **EM 652** 182167-04-0, EM 762 182167-58-4, EM 651
RL: BAC (Biological activity or effector, except adverse); BSU (Biological study, unclassified); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(characterization of effects of novel non-steroidal antiestrogens on basal and **estrogen**-induced proliferation of T-47D, ZR-75-1 and MCF-7 human breast cancer cells in vitro)

L7 ANSWER 23 OF 24 CAPLUS COPYRIGHT 2005 ACS on STN
AB . . . effects of the novel nonsteroidal pure antiestrogen EM-800 and related compds. with those of a series of antiestrogens on the **estrogen**-sensitive alkaline phosphatase (AP) activity in human endometrial adenocarcinoma Ishikawa cells. Exposure to increasing concns. of up to 1000 nM EM-800 or its active metabolite **EM-652** alone failed to affect basal AP activity. In contrast, incubation with 10 nM (Z)-4-OH-tamoxifen, (Z)-4-OH-toremifene, droloxifene, or raloxifene increased the value of this **estrogen**-sensitive parameter by 3.3-, 3.5-, 2.2-, and 1.6-fold, resp., a stimulatory effect that was completely reversed by simultaneous exposure to 30 nM EM-800. Moreover, the stimulation of AP activity induced by 1 nM 17β- **estradiol** was completely reversed by EM-800, **EM-652**, or ICI-182780, at the IC50 value of 1.98, 1.01, and 5.64 nM, resp., whereas the partial blockade exerted by (Z)-4-OH-tamoxifen,. . . 41.0, and 3.74 nM, resp. Thus, as assessed by their activity in the human Ishikawa endometrial carcinoma cells, EM-800 and **EM-652** are the most potent known antiestrogens in Ishikawa cells, and, most importantly, they are devoid of the estrogenic activity observed. . .
ST antiestrogen **estrogen** alk phosphatase endometrium adenocarcinoma; tamoxifen alk phosphatase endometrium adenocarcinoma; toremifene alk phosphatase endometrium adenocarcinoma; droloxifene alk phosphatase endometrium adenocarcinoma; rodroloxifene alk phosphatase endometrium adenocarcinoma; EM 800 alk phosphatase endometrium adenocarcinoma; **EM 652** alk phosphatase endometrium adenocarcinoma
IT 68047-06-3, Hydroxytamoxifen 82413-20-5, Droloxifene 84449-90-1, Raloxifene 110503-62-3 129453-61-8, ICI-182780 **182167-02-8**, **EM 652** 182167-03-9

RL: ADV (Adverse effect, including toxicity); BAC (Biological activity or effector, except adverse); BSU (Biological study, unclassified); THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(blockade of stimulatory effect of **estrogens**, hydroxytamoxifen, hydroxytoremifene, droloxifene, and raloxifene on alkaline phosphatase activity by the antiestrogen EM-800 in human endometrial adenocarcinoma Ishikawa cells)

L7 ANSWER 24 OF 24 CAPLUS COPYRIGHT 2005 ACS on STN

AB Plant flavonoids reported previously to act as mol. signals in the arbuscular mycorrhizal (AM) symbiosis are known to bind to **estrogen** receptors and to exert estrogenic effects on mammalian cells. To further investigate the **estrogen**-like properties of flavonoids the present study examined whether **estrogen** and antiestrogens have flavonoid-related functions in AM fungi. Bioassays were performed in a monoaxenic system with the AM fungi Gigaspora. . . concns. ranging from 0.01 to 10.0 μM shows an estimated EC50 value of 3.26 μM. The present results show that 17β- **estradiol** (III) and II exert similar stimulatory effects in G. intraradices. The agonist effect of II was efficiently suppressed by the new antiestrogen **EM -652** (IV), which is also consistent with the possible presence of **estrogen**-binding sites in AM fungi.

IT 68047-06-3, Hydroxy-tamoxifen 131811-54-6, EM-139 **182167-02-8**, **EM 652**
